x AAZ34572 (1-5195)

This is the nucleotide sequence of full-length cDNA (clone 11)

CC corresponding to a novel human SH3 gene, termed the SH3D1A gene, that

CC contributes to the development of platelets and the pathogenesis of

CC leukaemias, both in general and in particular those involving the

CC megakaryocytic lineage. The SH3H1A gene maps to the small candidate

CC region for low platelets on chromosome 21. Sequencing of 5 different

CC sizes of cDNA clone from foetal brain (see AAZ34570-74) suggests that at

CC least 3 isoforms exist. The invention provides methods for the diagnosis

CC and treatment of megakaryocytic abnormality, myeloproliferative disorder,

CC platelet disorder, acute leukaemia, neural disorders, thromobocytopenia,

CC platelet disorder, acute leukaemia, neural disorders in deletion for 21,

CC association of gains in chromosome 21 with leukaemias, neural

CC and colpocephaly. Methods are also provided for: suppressing cells unable

CC and colpocephaly. Methods are also provided for: suppressing cells unable

CC regulate themselves; screening for a somatic alteration in the SHJDIA

CC gene; monitoring the progress and adequacy of a treatment; monitoring

CC disorder, haematopoietic disorder, platelet disorder or leukaemia; and

CC megakaryocytic abnormality, myeloproliferative

CC disorder, leukaemia or neural disorder using a nucleic acid that

CC expresses SHJDIA or its antisense nucleic acid

CX expresses SHJDIA or its antisense

Corresponding to a novel human SH3 gene, termed the SH3DIA gene, that Corresponding to a novel human SH3 gene, termed the SH3DIA gene, that Contributes to the development of platelets and the pathogenesis of Cleukaemias, both in general and in particular those involving the Creming for low platelets on chromosome 21. Sequencing of 5 different Sizes of cDNA clone from foetal brain (see AAZ34570-74) suggests that at cleast 3 isoforms exist. The invention provides methods for the diagnosis can treatment of megakaryocytic abnormality, myeloproliferative disorder, platelet disorder, acute leukaemia, neural disorders, thromobocytopenia, platelet disorder on chromosome 21 with leukaemias, neural cashociation of gains in chromosome 21 with leukaemias, neural corresponding cognitive dysfunctions, microcephaly, lissencephaly, and corresponding cognitive dysfunctions, microcephaly, lissencephaly, and corresponding cognitive dysfunctions, microcephaly, lissencephaly, gene; monitoring the progress and adequacy of a treatment; monitoring the progress and adequacy of a treatment; monitoring completed com
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CDS

Generally (I) (or its (ant)agonists, mimerics, fragments and inactive mutants); (I) specific antibodies (Ab); sequences antisense to the (I) polynucleotide; agents that downregulate expression of Ese genes or antagonists of an Ese binding partner are used to treat diseases associated with undesirable endocytosis and resulting changes in cellular function. Particularly overexpression of Ese is used to block clathrin-mediated endocytosis in vivo or in cell cultures, while administration of (I) is used to promote endocytosis of selected cells. (Ant)agonists of (I) or Ab are used to suppress abnormal proliferation of cells that can be stimulated to proliferate by a growth factor receptor; and similar compounds (also inactive Ese mutants) can be used to prevent viral infection. Endocytosis may also be regulated, in vivo or in cell cultures, by forming an Ese-Esp15 complex, then binding dynamin to the
                                                                                                                                                                                                                                     variants (Bse = EH-domain and SH3-domain regulator of endocytosis). (I) are involved in regulation of clathrin-mediated endocytosis (as a complex

cc mediated endocytosis (as a complex with Esp15 protein), vesicular crafficking and actin cytoskeleton. Generally (I) (or its (ant)agonists, complexics, fragments and inactive mutants); (I)-specific antibodies (Ab); cc sequences antisense to the (I) polynuclectide; agents that downregulate ct treat diseases associated with undesizable endocytosis and resulting cc changes in cellular function. Particularly overexpression of Ese1 is used ct block clathrin-mediated endocytosis in vivo or in cell cultures, while can be stimulated to promote endocytosis of selected cells. Cc (Ant)agonists of (I) or Ab are used to suppress abnormal proliferation of cells that can be stimulated to proliferate by a growth factor receptor; and similar compounds (also inactive Ese mutants) can be used to prevent cutures, by forming an Ese-Esp15 complex, then binding dynamin to the complex. Generally conditions that can be tracted include cancer; abnormal cell division or migration; viral infection; or abnormal cell division or migration; viral infection; or abnormal cell division or migration; viral infection; or abnormal present sequence represents mouse Ese11 coding sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention specifically describes mammalian Esel and 2 CC proteins (I) and their splice variants (Ese = EH-domain and SH3-domain CC regulator of endocytosis). (I) are involved in regulation of clathrin-cc mediated endocytosis (as a complex with Esp15 protein), vesicular CC minetics, fragments and inactive mutants); (I) (or its (ant)agonists, CC endocytosis (as a complex endocytosis), vesicular CC endocytosis (as a complex with Esp15 protein), vesicular CC expression of Ese genes or antagonists of an Ese binding partner are used to the complex to the (I) polynucleotide; agents that downregulate to treat diseases associated with undesirable endocytosis and resulting CC changes in cellular function. Particularly overexpression of Esel is used CC to treat diseases associated with undesirable endocytosis and resulting CC changes in cellular function. Particularly overexpression of Esel is used CC to block clathrin-mediated endocytosis in vivo or in cell cultures, while CC administration of (I) is used to promote endocytosis of selected cells. CC ells that can be stimulated to proliferate by a growth factor receptor; CC and similar compounds (also inactive Ese mutants) can be used to prevent CC cultures, by forming an Ese-Esp15 complex, then binding dynamin to the CC complex. Generally conditions that can be treated include cancer; CC abnormal cell division or migration; viral infection; or abnormal CC complex formalling. Transmission The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Percent Similarity:

C polycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine c disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic c shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and captinitis), immune disorders (e.g., congenital and acquired communities), immune disorders (e.g., anaemia), cardiovascular disorders, conjunctions of communities and confers, autoimmune oophoritis, systemic lupus erythematosus), c blood-related disorders (e.g., anaemia), cardiovascular disorders, ceptiratory disorders, neurological disorders, gastrointestinal disorders and urinary system disorders. Ovarian antigen polypeptides and polymucleotides may also be used in screening for compounds which communities ovarian antigen expression or activity. The polymucleotides may compound the constitution of individuals and in forensic analysis, and the collection of individuals and in forensic analysis, and the collection of useful in disease diagnosis, drug targeting and phenotyping. The present colly experied the printed specification, but was obtained in electronic format directly from with the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of ovarian antigen polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, ar metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovariancer), immune disorders, cardiovascular disorders and neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    polynucleotides, antibodies against human ovarian antigens,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  recombinant vectors and host cells comprising human ovarian antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; SEQ ID NO 887; 2922pp; English

CC responsible for genetic disorders or other traits to assess biodiversity corresponsible for genetic for genetic disorders or other traits to assess biodiversity to assess and polymeria and polymeriation of corresponsible for generating and its biodiversity to fill of size, as molecular weight markers and as a food corresponding to the sequence tags for identifying expressed corresponding to the therapy techniques to restore normal corresponding to the training and the sequence tags for identifying expressed corresponding to the training and the sequence tags for identifying expressed corresponding to the training and the sequence tags involving (II). (II) is considered the sequence and the sequence and the sequence and the sequence are useful in medical imaging constitutes and polymeratic expression or biological activity. The collapse of the sequence mapping, identification of mutations in the sequence applications in the sequence and polymeratic disorders or other traits to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 30-MAR-2001; 2001WO-US008631
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Homo sapiens

Multivalent RU complexes are particularly suited to screening for polypeptides containing functional domains that are similar to, but not identical in sequence to, the original target functional domain. The new method enables proteins having a common function to be identified. Identification of novel SH3 proteins will be useful for a better understanding of cell growth, malignancy, signal transduction processes, etc. New candidate drugs can be signal transduction processes, etc. New candidate drugs can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 747 BP;

The method is based on functional similarities and does not rely on sequence similarities. Prior methods only gave limited success for identifying proteins which contain an SH3 domain due to the minimal sequence homology among known SH3 proteins. It has been found that small peptide RUs in multivalent form have reduced specificity for a given
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the method of the invention. SH3 domain containing proteins play a role in signalling and structural elements of cells. The method of the invention is for identifying polypeptides containing functional domains of interest (especially SH3 domains). The method comprises contacting a multivalent recognition unit (RU) complex with a number of peptides and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 No.:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAT39786-T39803 represent novel human and mouse genes encoding Srchomology region 3 (SH3) domain containing proteins that can be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 76; Fig 52; 174pp; English.

SH3 domain containing proteins that can be used in the method of the invention. SH3 domain containing proteins play a role in signalling and structural elements of cells. The method of the invention is for identifying polypeptides containing functional domains of interest (especially SH3 domains). The method comprises contacting a multivalent recognition unit (RU) complex with a number of peptides and identifying polypeptides having a selective binding affinity for the RU complex. The method is based on functional similarities and does not rely on sequence similarities. Prior methods only gave limited success for sequence homology among known SH3 proteins. It has been found that small peptide RUs in multivalent form have reduced specificity for a given functional domain compared to monomer RUs. Multivalent RU complexes are
                                                                                                                                                                 Sequence 2873 BP; 903 A; 506

Complex. Sequence encouses maybe asset and 2 proteins (I) and their splice consists (Bse = EH-domain and SHI-domain regulator of endocytosis). (I) consists (Bse = EH-domain and SHI-domain regulator of endocytosis) (I) consists (Bse = EH-domain and SHI-domain regulator of endocytosis (As a complex consists (Bse = EH-domain and SHI-domain regulator of endocytosis (As a complex consists); (I) consists (As), sequences antisense to the (I) constants); (I) -specific antibodies (Ab); sequences antisense to the (I) consists of an Ese binding partner are used to treat diseases or consisted with undestrable endocytosis and resulting changes in cellular associated with undestrable endocytosis and resulting changes in cellular consisted endocytosis in vivo or in cell cultures, while administration of consisted endocytosis in vivo or in cell cultures, while administration of constitue to promote endocytosis of selected cells. (Antiagonists of be stimulated to proliferate by a growth factor receptor; and similar compounds (Also inactive Ese mutants) can be used to prevent viral cultures, by forming an Ese-Espli complex, then binding dynamin to the complex. Generally conditions that can be treated include cancer;

```
The invention describes an isolated nucleic acid molecule (I) encoding a CC novel central nervous system protein. (I) and polypeptides (III) encoded CC by (I), are used to treat a medical conditions and in diagnosis of a CC pathological condition. Disorders which are diagnosed or treated include CC pathological condition. Disorders which are diagnosed or treated include CC autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative CC disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cerebral ischaemia, CC angiogenesis, nervous system disorders e.g. Alzheimer's disease and CC angiogenesis, nervous system disorders e.g. Alzheimer's disease and CC angiogenesis, nervous system disorders e.g. Alzheimer's disease and CC e.g. Acquired immunodeficiency virus (AIDS) and fungi, ocular disorders e.g. Acquired immunodeficiency virus (AIDS) and fungi, ocular disorders e.g. caned the collular disorders adenocarcinomas and irritable bowel syndrome, reproductive system CC and pituitary dwarfism, canners and disorders at the cellular level e.g. CC and visual disorders e.g. monallers at the cellular level e.g. respiratory disorders e.g. nonallers rhinitis, renal disorders e.g. acute kidney failure and blood related disorders e.g. myocardial cc infarction. The polypeptides can also be used to aid wound healing and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                17-NOV-2000;

SH3 domain containing proteins play a role in signalling and structural elements of cells. The method of the CC invention is for identifying polypeptides containing functional domains CC finterest (especially SH3 domains). The method comprises contacting a CC multivalent recognition unit (RU) complex with a number of peptides and CC complex. The method is based on functional similarities and does not rely consider. The method is based on functional similarities and does not rely considered similarities. Frior methods only gave limited success for consequence similarities. Frior methods only gave limited success for consequence homology among known SH3 proteins. It has been found that small comparticularly suited to screening for plypeptides specificity for a given containing that are similar to, but not identical in sequence to, the coriginal transduction to be identified. Identification of novel SH3 proteins a common function to be identified. Identification of novel SH3 proteins is that are similar to, but not identification of novel SH3 proteins containing functional domain that are similar to, but not identification of novel SH3 proteins are signal transduction processes, etc. New candidate drugs can be contained, which method of the invention
                                                                                                                                                                                                 RESULT 2

This is the nucleotide sequence of a non-full-length cDNA (clone 9) corresponding to a novel human SH3 gene, termed the SH3DlA gene, that CC contributes to the development of platelets and the pathogenesis of CP leukaemias, both in general and in particular those involving the CC megakaryocytic lineage. The SH3DlA gene maps to the small candidate region for low platelets on chromosome 21. Sequencing of 5 different CC sizes of cDNA clone from foetal brain (see ARZ4570-74) suggests that at CP least 3 isoforms exist. The invention provides methods for the diagnosis and treatment of megakaryocytic abnormality, myeloproliferative disorder, platelet disorder, acute leukaemia, neural disorders, thromobocytopenia, CP platelet disorder, acute leukaemia, neural disorders, thromobocytopenia, CP platelet disorder, acute leukaemia, neural disorders, thromobocytopenia, CP platelet disorder, acute leukaemia, neural disorders, neural abnormalities, dysfunctions and disorders including brain malformations can dolpocephaly. Methods are also provided for: suppressing cells unable crossing the progress and adequacy of a treatment, monitoring the progress and adequacy of a treatment, monitoring the progress or megakaryoctyic abnormality, myeloproliferative disorder, platelet disorder, leukaemia; and collacorder, leukaemia or neural disorder using a nucleic acid that crossess SH3DlA or its antisense nucleic acid that

P-PSDB; AAY32155

Nucleic acid from the human SH3D1A gene and its products, useful for the diagnosis and treatment of myeloproliferative disorders and leukemia.

Fig 8; 99pp; English.

ce megakaryocytic lineage. The SHADIA gene maps to the small candidate region for low platelets on chromosome 21. Sequencing of 5 different ce sizes of cDNA clone from foetal brain (see AAZ34570-74) suggests that at ce least 3 isoforms exist. The invention provides methods for the diagnosis cand treatment of megakaryocytic abnormality, myeloproliferative disorder, platelet disorder, acute leukaemia, neural disorders, thromobocytopenia, ce platelet disorder on chromosome 21, low platelets in deletion for 21, caspociation of gains in chromosome 21 with leukaemias, neural corresponding cognitive dysfunctions, microcephaly, lissencephaly, and corresponding cognitive dysfunctions, microcephaly, lissencephaly, cand colpocephaly. Methods are also provided for: suppressing cells unable to regulate themselves; screening for a somatic alteration in the SH3DIA ce disorder, haematopoietic disorder, platelet disorder of eukaemia; and creatment of a subject (including a prenatal subject) having treatment of a subject (including a prenatal subject) having ce megakaryocytic abnormality, myeloproliferative disorder, platelet clisorder, platelet clisorder, leukaemia or neural disorder using a nucleic acid that ce expresses SH3DIA or its antisense nucleic acid This is the nucleotide sequence of full-length cDNA (clone 21) corresponding to a novel human SH3 gene, termed the SH3D1A gene, t contributes to the development of platelets and the pathogenesis cleukaemias, both in general and in particular those involving the of

Generally (I) (or its (ant)agonists, mimetics, fragments and inactive mutants); (I) -specific antibodies (Ab); sequences antisense to the (I) polymuclectide; agents that downregulate expression of Ese genes or attagonists of an Ese binding partner are used to treat diseases associated with undesirable endocytosis and resulting changes in cellular function. Particularly overrexpression of Ese1 is used to block clathring mediated endocytosis in vivo or in cell cultures, while administration of (I) or Ab are used to suppress abnormal proliferation of cells that can compounds (also inactive Ese mutants) can be used to prevent viral infection. Endocytosis may agrowth factor receptor; and similar infection. Endocytosis may also be regulated, in vivo or in cell
                                     AAZ39008;
                                                                 AAZ39008 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           infection. Endocytosis may also be regulated, then binding dynamin to the cultures, by forming an Ese-Esp15 complex, then binding dynamin to the complex. Generally conditions that can be treated include cancer; abnormal cell division or migration; viral infection; or abnormal receptor signalling, tissue development or synaptic transmission
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 3723 BP; 1065 A; 941

CC The present sequence encodes mouse Esel. The present invention CC specifically describes mammalian Esel and 2 proteins (I) and their splice CC variants (Ese = EH-domain and SH3-domain regulator of endocytosis). (I) CC are involved in regulation of clathrin-mediated endocytosis (as a complex CC with Espl5 protein), vesicular trafficking and actin cytoskeleton. CC Generally (I) (or its (ant)agonists, mimetics, fragments and inactive mutants); (I) specific antibodies (Ab); sequences antisense to the (I) CC polynucleotide; agents that downregulate expression of Ese genes or CC antagonists of an Ese binding partner are used to treat diseases CC associated with undesirable endocytosis and resulting changes in cellular CC mediated endocytosis in vivo or in cell cultures, while administration of CC is used to promote endocytosis of selected cells. (Ant)agonists of SC (I) is used to promote endocytosis of selected cells. (Ant)agonists of SC (I) or Ab are used to suppress abnormal proliferation of cells that can CC compounds (also inactive Ese mutants) can be used to prevent viral compounds (also inactive Ese mutants) can be used to prevent viral infection. Endocytosis may also be regulated, in vivo or in cell cultures, by forming an Ese-Esp15 complex, then binding dynamin to the complex. Generally conditions that can be treated include cancer; abnormal cell division or migration; viral infection; or abnormal receptor signalling, tissue development or synaptic transmission Sequence 5082 BP; 1363 A; 1253 C; 1391 G; 1075 T; 0 U; 0 Other,

            The present invention specifically describes mammalian Esel and 2 proteins (I) and their splice variants (Ese = EH-domain and SH3-domain CC regulator of endocytosis (as a complex with Espl5 protein), vesicular creditated endocytosis (as a complex with Espl5 protein), vesicular creditated endocytosis (as a complex with Espl5 protein), vesicular creditated endocytosis (as a complex with Espl5 protein), vesicular creditated endocytosis (as a complex with Espl5 protein), vesicular creditated and inactive mutants), (I)-specific antibodies (Ab); complex endocytosis and sential endocytosis that complex that downregulate endocytosis that can be stimulated with undestrable endocytosis and resulting that can be stimulated to promote endocytosis of Selected cells. (Ant)agonists of (I) or Ab are used to suppress abnormal proliferation of cell wiral infection. Endocytosis may also be regulated by a growth factor receptor; and similar compounds (also inactive Ese mutants) can be used to prevent viral infection. Endocytosis that can be regulated, in vivo or in cell cultures, by forming an Ese-Espl5 complex, then binding dynamin to the complex. Generally conditions that can be treated include cancer; complex. Generally conditions that can be treated include cancer; the complex of the cancer of the complex of the cancer of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          regulation; actin cytoskeleton; detection; cancer; EH-domain and SH3-domain regulator of endocytosis;

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food

                                                                                                                                                                                                                                                                                                                                                                                                              13-FEB-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the printed specification, but was obtained in the printed specification.
                                                                                                                                                      (HYSE-)
                                                                                                                                                                                                                                                                                                                                                                              DNA encoding novel human diagnostic protein #20563
                                                                                                                                                                                                                                                                                                                                                                                                                                            AAS84759;

generation (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymerase chain of indiagnostics as expressed sequence tags for identifying expressed combinant production of the polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed combinated in gene therapy techniques to restore normal combination of the treat disease states involving (II). (II) is considered in tissue, as molecular weight markers and as a food complement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) are useful for treating disorders involving abserrant protein expression or biological activity. The completice and polymucleotide sequences have applications in conditions for exponsible for genetic disorders or other traits to assess biodiversity responsible for genetic disorders or other traits to assess biodiversity amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO as

  The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fig. wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 206

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ABS14329
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements) fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 206

cc derived from human lung, uneasuring gene expression in a sample collection of detectably labeled nucleic acids derived from human lung comprising (a) contacting the array with a array; identifying exons in a enkaryotic genome, comprising (a) calgorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably the eukaryotic acids from eukaryote lung mRNA, to a single exon probe in the eukaryote; and (b) detecting specific hybridisation of detectably comprising (a) identifying exons to the probe is included in the above mentioned microarray; assigning exons to a single exon probe comprising (a) identifying exons from genomic sequence by the method comprising (a) identifying exons so a single exon probe with the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon comprosized above and (b) measuring the expression of each of the exons in several the exons should be assigned to a single exon where a common pattern of compression of the exons in the tissues and/or cell types indicates that the exons in the tissues and/or cell types indicates that the exons in the probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human compression of trames (ORF). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human compression content of the shudy of lung diseases such as asthma, lung called the shudy of lung diseases such as asthma, lung called the exons shudy of lung diseases such as asthma, lung called the exons probe open reading frame of the printed specification, but was obtained in electronic format directly convention. Note: The sequence data for this pattent did not form part of the printed specification, but was obtained in electronic format directly conventions.
